

Revised Tankmaster from Braude

The Tankmaster Mp is a combined temperature and level controller from Braude. It is supplied complete with non corrodable temperature and level sensors for use in the corrosive solutions found throughout the Finishing industry.

The controller is designed for surface mounting and sealed to IP65 so it is suitable for use close to the point of use providing an easily read display for the operator of tank conditions. The revised MP version of the Tankmaster provides a display of the set point as well as the temperature of the bath and has no external buttons or knobs so preventing the accidental alteration of the setting.

Additional features of the new controller are:

- Secondary set point either from a single or an ancillary probe.
- Drop back facility to enable a lower set point temperature to be selected, which is ideal to allow maintenance of a tank over a weekend.
- Operating band go / no go indication for critical process operation
- High / high and low / low liquid level settings

All the features are easily programmable by the end user or alternatively can be preset in the factory prior to despatch.

The product is backed up by Braude's experience of many years manufacturing and supplying equipment for arduous environments and is provided with a full 12 month guarantee.

The popular Thermaster and Levelmaster controllers are still available from Braude and all probes are interchangeable with the Tankmaster.
